WHY is this preparatory knowledge important? -> Keys/signatures point to something too! (Moneybox example)

This Episode!

## PUBLIC-PRIVATE KEYS and safety

The lack of Economic Incentives will save  
your private ECDSA-ass;  
but **YOU** might be the party pooper!

@henkvancann and @bcworkspace

3

ECDSA = Elliptic Curve Digital Signature Algorithm

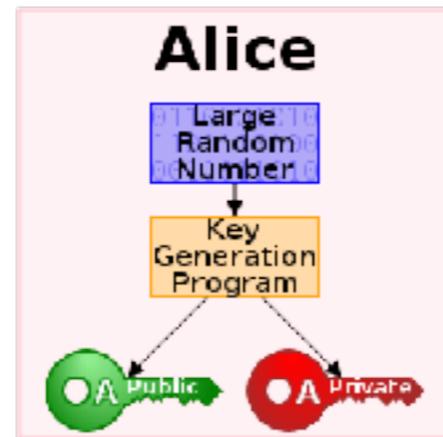

Economic Incentives versus Distributed / Decentralized consensus: it costs more than its return, the risk is too high to lose more than you might profit

but WE ACCEPT a certain technical chance that it happens, based on it's assessed likelihood and impact (what's at stake? and what's the probability)

WHY do I say this? To anticipate the Quantum Computing FUD storm

Is our feeling of vulnerability justified?! Are we really in danger while trying to cling to our crypto value? And if so, how can we better prepare, better assurance, and start developing an automatism in protecting ourselves?

## Public Private Key-pairs

As boring  
as batshit!

Source: [https://en.wikipedia.org/wiki/Public-key\\_cryptography](https://en.wikipedia.org/wiki/Public-key_cryptography)

One way! Private to public  
One way? Quantum computing...  
DANGER FROM THE OUTSIDE?!

<Connect: Who has > <How can that be... we have {any crazy amount} of dollars of value represented in the room?>

**Safety?! Ask yourself constantly:  
Did we secure the digital keys  
well enough?**

@henkvancann and @bcworkspace

5

<safety bar versus safety belt in a cart of the Python (a looping ) in the Efteling adventure-park, my father desperately seeking the belt while the bar's already there; panicing, tormented face and automatism.>

<floorwork: quadrant IN/OUT - Real/Unreal Threads versus feeling Safe/in danger>

Suddenly 'we' ....., why?

Inheritance, succession, organisations! -> DANGER FROM THE INSIDE

# Fear, Uncertainty & Doubt (FUD)

## JUSTIFIED?!

@henkvancann and @bcworkspace

6

<ask for recent examples of FUD>

Is it justified to feel in danger to feel vulnerable? In most cases 'no'

<analogy: game in the dark, one or more the opponents might have night vision glasses... >

What can you do? Study <learn to handle the night camera>, <protect yourself>

...and more over it might divert our attention....

## NIETZSCHE?:

“Man often suffers most  
From the sufferings he fears  
But never will occur.  
So he will have more to bear  
Than God gives to bear.”

ANTONPOULOS:  
There is no 'mining'  
There is no 'bit'  
There is no 'coin'  
There is no 'address' or 'account'  
There is no **'wallet'**  
There is no 'transaction'

These names serve as a bridge between old world new world. They enhance understanding, foothold and assurance: "Oooh, it's a sort of gold coin, that ends in my wallet by a global transaction"...

Is this only positive? No, because it might introduce a dangerous feeling of security -> Wallet  
Is our feeling of safety justified?!

# What do most relevant crypto keys LOOK LIKE?

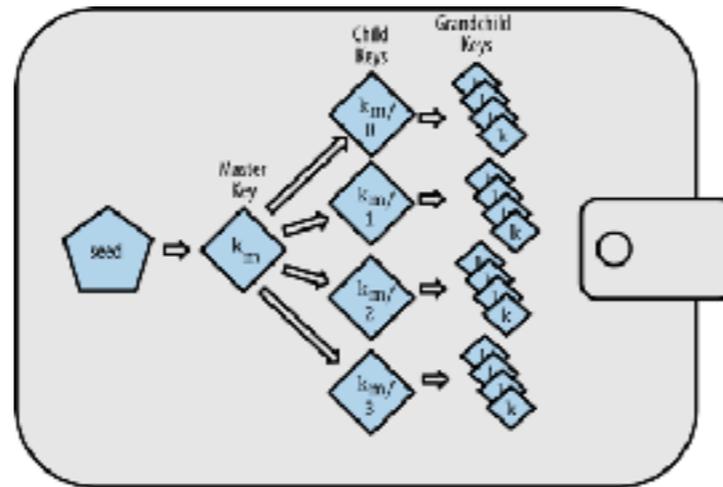

- Shamirs
- Secret
- Sharing
- Scheme
  
- K subkeys needed
- out of N subkeys

Inheritance > sort of 'treasure map' solution: 3 (remaining) people can form a group to find the private master key.

## Hierarchical Deterministic Keychains

Source: <http://nakamotoinstitute.org/bitcoin/#selection-229.4-232.0>

Blockchain Workspace [www.blockchainworkspace.com](http://www.blockchainworkspace.com)

10

<take out keychain>

A bitcoin address is in fact the hash of a ECDSA public key, BASE58 encoded

BIP0032

<https://bitcoinmagazine.com/articles/deterministic-wallets-advantages-flaw-1385450276/>

Should be unidirectional, point “backwards” only if you want and in a controlled way!

Vitalik Buterin 2013 (18 yrs old):

The problem is this: although you certainly can securely hand out child keys with no risk to the parent key, and you can hand out master public keys with no risk to the master private key, you cannot do both at the same time.

Solution : a. Don't hand out master public key

b. making three hierarchical BIP32 wallets, with every address being a 2-of-3 multisignature address between the three wallets down some particular child key derivation path

“

Blockchain Workspace [www.blockchainworkspace.com](http://www.blockchainworkspace.com)

x

In cryptography, the Elliptic Curve Digital Signature Algorithm (ECDSA) offers a variant of the Digital Signature Algorithm (DSA) which uses elliptic curve cryptography.

### Key and signature-size comparison to DSA

As with elliptic-curve cryptography in general, the bit size of the public key believed to be needed for ECDSA is about twice the size of the security level, in bits. For example, at a security level of 80 bits (meaning an attacker requires a maximum of about  $2^{80}$  operations to find the private key) the size of an ECDSA public key would be 160 bits, whereas the size of a DSA public key is at least 1024 bits. On the other hand, the signature size is the same for both DSA and ECDSA: approximately  $2 \times \text{security level}$  bits, where  $\text{security level}$  is the security level measured in bits, that is, about 320 bits for a security level of 80 bits.

Future:

## Infringement of feeling safe or fraud

VIOLENCE

THEFT

MISLEAD

EVASION

ACCIDENTAL

people are the decisive factor!

"If you control your keys, it's your bitcoin. If you don't control the keys, it's NOT your bitcoin."

Andreas Antonopoulos, 2015

<safety belt>

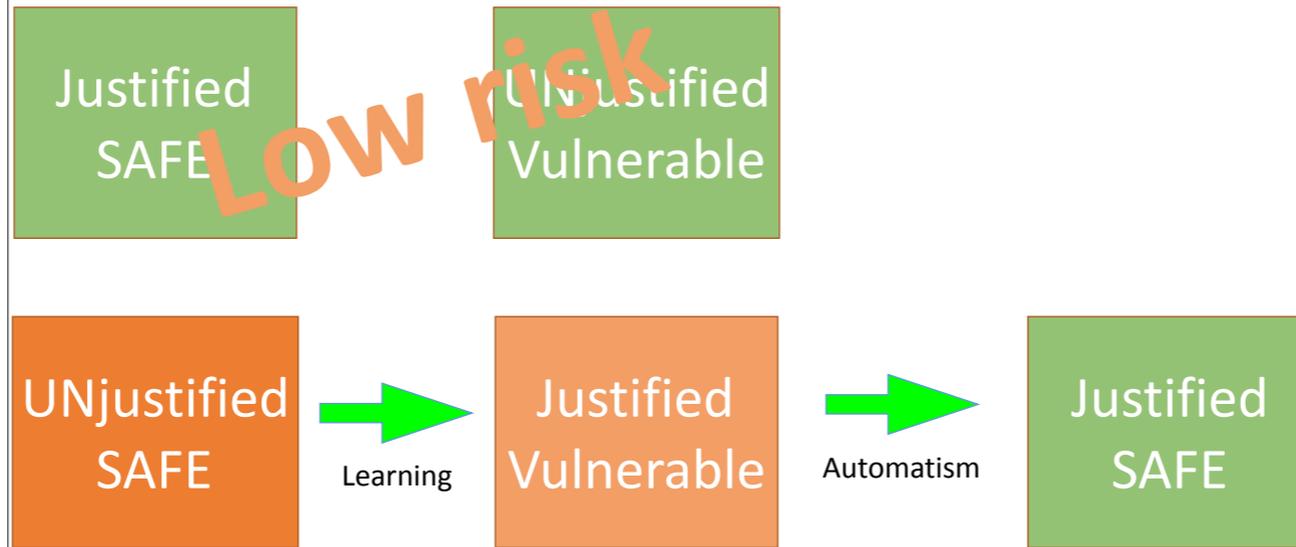

"If you control your keys, it's  
your bitcoin. If you don't control  
the keys, it's NOT your bitcoin."

[Andreas Antonopoulos, 2015](#)

# "Why you have to carefully manage your keys. And why you won't"

Henk van Cann 2018 :)

It is not a one-off, instead it is a learning curve and psychological barriers to overcome.

It is not a one-off, instead it is a learning curve

The lack of Economic Incentives will save  
your ass in general;  
but **YOU** might be the party pooper!

@henkvancann and @bcworkspace

VectorStock® VectorStock.com/1720067

<You are in the house - how safe do you feel?>

How likely will it be that thieves get caught and your value returned?

- Complexity, difficult to enter
- Money & time, the costs higher than the benefits
- Discoverability, is a thief exposed?
- Maturity, how old is the technology?
- Recoverability, can I get my value back?

**Economic incentives!**

Security is always about "me":

The Technical network is solid and resilient! Faults, tampering, robbery, etc. by human beings!

Maturity : compare to how it used to be with electricity or aviation....

### Informatie nu opgeslagen voor later

Het is verkeerd om te denken dat er nog geen probleem is, omdat het nog lang duurt voor wetenschappers 'klaar' zijn met de kwantumcomputer, zegt Tanja Lange, hoogleraar cryptologie aan de TU Eindhoven. Ze verwees naar de affaire rond Edward Snowden, de klokkenluider die grootschalige af luisterpraktijken van de Amerikaanse geheime dienst NSA naar buiten bracht. 'We weten dankzij Snowden dat geheime diensten alle communicatie opnemen en bewaren. Wat nu nog niet kan worden ontsleuteld, wordt alvast opgeslagen voor over twintig jaar, als de kwantumcomputer er is.'

Bron citaat: [FD artikel](#)

Speech op SURFnet - [slides](#), CC by SA Tanja Lange.

**Safety?! Ask yourself constantly:  
Did we secure the digital keys  
well enough?**

@henkvancann and @bcworkspace

- ‘my failure to implement good security wasn’t totally my fault; it was a **combination of misunderstanding the risks, overestimating the effort it takes to implement**’
- ‘I had heard about people **getting hacked**. But it was **always other people**’
- ‘**the risk wasn’t real enough for me to do anything about it**’
- ‘Maybe you’re like I used to be: **simply unsure of what to do — so you do nothing**’

Where are you?

Stay inside the herd: Avoid risky behaviour - learn - stay fit with automatism

- **‘Basic good security practices** are now part of my **routine** without even noticing. **Like putting on a seatbelt** after getting into a vehicle, it’s just something I do.’

Pamela Morgan @pamelawjd · Feb 10

Currently, my cryptoasset estate plan (for who gets what when I die) is:

24% tech only (keys)

5% legal only (will, trust)

16% tech & legal

55% I'm gonna live forever

- [LINK TO ARTICLE](#)

1. Mistaken Belief: I have to hire a lawyer.
2. Mistaken Belief: I have to trust a third party.
3. Mistaken Belief: Planning will make my assets easy to steal.
4. Mistaken Belief: The value of my cryptoassets is too low to plan.
5. Mistaken Belief: My heirs will figure it out.
6. Mistaken Belief: This can all be done with a simple smart contract.

**NEXT Episode!**

**HOW** to manage your crypto  
value / estate

@henkvancann and @bcworkspace

## DON'TS of crypto key management

**As soon as some significant value is involved, use as little as possible...**

- weak passwords
- hot wallets in any form
- brain wallets solo
- unmanaged passwords
- self invented seeds
- online computers to generate/print single paper wallets

Web, mobile, etc.

Solo -> without anybody knowing it

Not 100% sure but also do not:

- follow a step by step, created by yourself or an external source, because it introduces new vulnerabilities
- no mobile phone as a security factor

# DO's of crypto key management

## Techniques, routines I recommend to test whether it works for you...

- managed strong passwords
- *Choose Wallet*: Create, backup, use hierarchical keys (from seeds)
- 2FA
- 3FA (Challenge Response Authentication)
- generated seeds
- spread over copies
- spread over media
- spread over geo-locations
- split over controlling people
- Paper wallets
- Cold stores
- Managed brain wallets

IAM Authentication: something you have, you are and you know

HOW??!! you ask someone else the details

Good question, because you obviously want to learn, but...

What if the expert is not trustworthy?

A managed brain wallet is something your loved ones can remember when you are not there anymore, a shared secret, indirectly put writing. Example: all family members remember that their lovely but long deceased dog jumped into a bassin back in 1994, the dog pulled out a puppet that looked like Elvis, that was funny. So you might write down: 'Pepper swim 1994' but only a subset of your beloved ones know the seed that is meant with that, which is 'Dog jump bassin Elvis out'

Never mention the sentence itself ever again, repeat it to each other only once a year and always refer to 'Pepper swim 1994' when mentioning the passphrase. Just an example of course.
